

Orbit XR

Installation Guide · version 0.1.0

Orbit XR is a macOS app for working with PICO and Meta Quest VR headsets over USB: files, screenshots and recordings, logs, screen casting and APK installation.

MAC

Apple Silicon (M1+)

MACOS

13 Ventura or newer

INSTALLER

Orbit-XR-0.1.0-arm64.dmg

1 Install adb

Orbit XR talks to the headset through `adb` from Android Platform Tools. It is not bundled with the app.

1. Open Terminal (Spotlight: ⌘Space, type “Terminal”).
2. If you don’t have Homebrew yet (`brew --version` says “command not found”), install it with the command from brew.sh, then run the two commands it shows at the end under “Next steps”.
3. Install adb:

```
brew install --cask android-platform-tools
```

4. Check it: `adb version` prints a version number.

If you already have adb from Android Studio (`~/Library/Android/sdk/platform-tools`), Orbit XR finds it automatically. You can pick any other adb (for example, the one from Unity) in Orbit XR: **Settings** → **Connection** → **Choose...**

2 Install the app

1. Double-click the `.dmg` file.
2. Drag **Orbit XR** onto **Applications** in the window that opens.
3. Close the window and eject the “Orbit XR” disk (🗑 in Finder).

3 First launch

Orbit XR is not signed by Apple, so macOS blocks it the first time. You only need to do this once.

1. Open **Applications** and double-click **Orbit XR**. macOS warns that it can’t verify the app. Click **Done** (or **OK**) — not “Move to Trash”.

2. Open the Apple menu → **System Settings** → **Privacy & Security** and scroll down to **Security**.
Next to the Orbit XR message, click **Open Anyway** and confirm with your password or Touch ID.
3. Open Orbit XR again and click **Open** in the prompt.

If macOS says Orbit XR “is damaged and should be moved to the Trash”, run this in Terminal and open Orbit XR again:

```
xattr -dr com.apple.quarantine "/Applications/Orbit XR.app"
```

From then on it opens normally — from the Dock, Launchpad or Spotlight.

4 Connect a headset

1. Turn on developer mode on the headset:
 - **PICO:** Settings → General → About, tap **Software Version** seven times; then turn on **USB Debugging** in Settings → Developer.
 - **Meta Quest:** in the Meta Horizon app on your phone: Devices → your headset → Headset Settings → Developer Mode (requires a Meta developer account).
2. Connect the headset to your Mac with a USB-C cable that carries data (not a charge-only cable).
3. **Put the headset on:** an “Allow USB debugging?” prompt appears inside. Check “Always allow from this computer” and tap **Allow**.
4. In Orbit XR, the device card with the model and battery level appears in the top left.

If Orbit XR shows “adb isn't installed”, go back to step 1 and then click **Try again**.

5 Help and reporting problems

- **Help:** the ? button at the bottom of the sidebar, or **Help** → **Orbit XR Help**. It covers keyboard shortcuts, how everything works, and a Troubleshooting section with common problems (headset not detected, adb, using Unity at the same time, APK installation).
- **Report a problem:** write to the author (Taras Hulka) and include:
 - the version from **Orbit XR** → **About Orbit XR** (number, date and commit);
 - the headset model;
 - what you did and what happened (a screenshot of the window helps);
 - for problems with an app on the headset — the logs: **Logs (⌘J)** → **Save...**

Orbit XR is provided “as is”, without warranty of any kind. PICO is a trademark of ByteDance. Meta Quest is a trademark of Meta Platforms, Inc. Orbit XR is an independent tool and is not affiliated with or endorsed by them.
