

Orbit XR

Installation Guide · version 0.3.0 · by Hulka Labs

Orbit XR is a desktop app for working with PICO and Meta Quest headsets: files, screenshots and recordings, Unity logs, screen casting, app management and APK installation — over USB or Wi-Fi.

MACOS

macOS 13 Ventura or newer,
Apple Silicon (M1+)
Orbit-XR-mac-arm64.dmg

WINDOWS

Windows 10 or 11, 64-bit
(x64)
Orbit-XR-win-x64.exe

DOWNLOAD

or GitHub: [TarasHulka/orbit-xr-releases](https://github.com/TarasHulka/orbit-xr-releases)

1 Install adb

Orbit XR talks to the headset through `adb` from Android Platform Tools. It is not bundled with the app.

MACOS

1. Open Terminal (⌘Space, type “Terminal”).
2. If Homebrew is missing (`brew --version` says “command not found”), install it from brew.sh and run the “Next steps” commands it prints.
3. Install adb:

```
brew install --cask android-  
platform-tools
```

WINDOWS

1. Open PowerShell (Start menu, type “PowerShell”).
2. Install adb:

```
winget install  
Google.PlatformTools
```

3. Close PowerShell and open it again, so the new `adb` command is found.

Check it in either system: `adb version` prints a version number.

Already have adb from Android Studio or Unity? Orbit XR finds the Android Studio one automatically; any other adb can be chosen in **Settings → Connection → Choose...**

2 USB driver (Windows only)

macOS needs no drivers. On Windows the headset must be visible to adb:

- **Meta Quest:** install the **Meta Quest ADB driver** from Meta's developer website.
- **PICO:** Windows usually installs the driver by itself. If the headset is not found, install the **Google USB Driver**.

With the headset connected (see step 5), `adb devices` should list it as `device`.

3 Install the app

MACOS

1. Double-click `Orbit-XR-mac-arm64.dmg`.
2. Drag **Orbit XR** onto **Applications**.
3. Eject the “Orbit XR” disk (🗑️ in Finder).

WINDOWS

1. Double-click `Orbit-XR-win-x64.exe`.
2. The installer sets up Orbit XR for your user and starts it.
3. Later, open it from the Start menu or the desktop shortcut.

4 First launch

Orbit XR is not signed by Apple or Microsoft yet, so the system warns you the first time. You only need to do this once.

MACOS

1. Double-click **Orbit XR** in Applications. When macOS can't verify it, click **Done** — not “Move to Trash”.
2. Apple menu → **System Settings** → **Privacy & Security**, scroll to **Security**, click **Open Anyway**, confirm with password or Touch ID.
3. Open Orbit XR again and click **Open**.

If macOS says the app “is damaged”, run in Terminal:

```
xattr -dr com.apple.quarantine "/Applications/Orbit XR.app"
```

WINDOWS

1. When **Windows protected your PC** (SmartScreen) appears, click **More info**.
2. Click **Run anyway**.
3. If your antivirus asks, allow Orbit XR to run.

5 Connect a headset

1. Turn on developer mode:
 - **PICO:** Settings → General → About, tap **Software Version** seven times; then turn on **USB Debugging** in Settings → Developer.
 - **Meta Quest:** in the Meta Horizon phone app: Devices → your headset → Headset Settings → Developer Mode (needs a Meta developer account).
2. Connect the headset with a USB-C cable that carries data, not a charge-only cable.
3. **Put the headset on:** an “Allow USB debugging?” prompt appears inside. Check “Always allow from this computer” and tap **Allow**.
4. The device card with the model and battery level appears in the top left of Orbit XR.

Want to work without the cable? Use the **USB | Wi-Fi** switch in the device card, then unplug. The computer and the headset must be on the same network.

6 Help and problems

- **Built-in help:** the ? button at the bottom of the sidebar or **Help** menu — keyboard shortcuts, how everything works and Troubleshooting (headset not found, adb, drivers, Unity at the same time, APK installation).
- If Orbit XR shows **adb isn't installed**, go back to step 1 and click **Try again**.
- **Reporting a problem:** include the version from **About Orbit XR**, your operating system, the headset model, what happened (a screenshot helps) and, for problems with an app on the headset, the logs from **Logs → Save...**
